

DIMAS

Distributed Information Management and Administration System based on Lotus Notes

DIMAS offers modules for

- ◆ Configuration Management
- ◆ Test Management
- ◆ Action Item Management
- ◆ Risk Management

DIMAS

- ◆ easy to use
- ◆ adaptable to different processes
- ◆ flexible as it can be parameterised
- ◆ offers up-to-date information

Configuration Management

Correspondence, documents and review inputs can be administered in the database. It supports configuration identification, control and status accounting. An interface to the internet allows the user to receive information on new items by e-mail.

New versions can be announced by e-mail. If configuration information is already available, it is possible to import it into the database.

Action Item Management

They can be tracked based on the organisational unit, the status and a wide range of other information. In addition, it is possible to inform selected users by e-mail about changes in the status of an action item. Overdue action items will trigger an e-mail to selected users.

Test Management

The database support the management of test data during all phases, from internal tests to acceptance tests. If test data already exists, it can be imported.

The database manages test cases, test procedures, free tests, problem reports and test results. Just a few mouse clicks and up-to-date information on the test status (even from other locations) is at your fingertips.

Risk Management

In addition to the administration, it is possible to quantify risks by selecting a certain risk probability and severity. Versioning makes it possible to track the changes to the risk. It is also possible to inform selected users by e-mail about a new risk.

DIMAS helps you manage your project data. It also can be used in any distributed environment for large and complex as well as small projects.

Your Service Provider for Success
